C++ Software Tools for CANopen & EtherCAT Distributed Control

- Automatic Network Management
- Point-to-Point and Coordinated Motion
- CML is a collection of object-oriented C++ classes designed to simplify the integration of intelligent CANopen and EtherCAT servo and stepping motor drives into a PC based or embedded control architecture. The development of low-level code to control the network is eliminated. Communicationcard interfacing, PDO mapping, SDO data packing, synchronization and node-guarding are taken care of automatically by a few simple commands.
- The application programmer has direct access to DS-402 compliant motion functions (Enable, Homing, Get/ Set parameters, & single-axis moves). For a multi-axis control, a coordinated set can be created by the linkage class.

- C++ Source Code for PC's or Embedded Systems
- Supports Servo & Stepper Drives

Complex, multi-axis moves are possible when the application program generates a sequence of points that define position, velocity, and time (PVT). The drives buffer the PVT points, perform a cubic polynomial interpolation algorithm and synchronously update commanded position to generate the path through N-dimensional space.

CML is designed to enable the C++ programmer to create motion applications on a range of operating systems and processor boards. It can be used on a PC using the Microsoft Windows or Linux operating systems. CML can also run on an embedded processor with any realtime operating system.

CML Copley Motion Libraries

Description

WHAT IS CML?

CML is a collection of C++ classes that, when compiled in a C++ application, provide a programming interface to Copley Controls CANopen or EtherCAT-enabled digital servo and stepping motor drives.

WHY USE CML?

CML adds CANopen and EtherCAT functionality to C++ applications and eliminates the lowlevel coding to support communications over a CAN bus or EtherCAT network. In addition, CML eliminates the additional coding needed to support communication with devices operating under the CANopen protocol, the application layer that works over a CAN bus that is designed for motion control and other specialized types. CANopen devices have object-dictionaries that combine dedicated addresses for standard functions and other addresses for device-specific ones.

CML provides a high-level language interface to low-level functions that is efficient and robust. This greatly reduces development time and time-tomarket. At the same time, it enables programmers to focus on their application development and to treat the CANopen interface simply as a library of objects that are ready to use.

HOW DOES IT WORK?

CML provides an object-oriented interface during program development. CML communicates with the CAN interface via the driver provided by the interface manufacturer. For EtherCAT, CML uses a standard Ethernet NIC (Network Interface Card). At run-time, CML provides control of Copley CANopen or EtherCAT drives by managing all of the low-level bus communications necessary to provide those services.

GENERAL SPECIFICATIONS

PRODUCT TYPE

C++ class source-code files

OPERATING SYSTEMS SUPPORTED

Microsoft Windows, Linux, or other POSIX compliant operating system

CANopen COMPLIANCE

CiA DSP-402, CANopen Device Profile for Drives & Motion Control CiA DS-401, CANopen Device Profile for Generic I/O Modules

CiA 301, Application Layer and Communication Profile

HARDWARE REQUIREMENTS (MINIMUM)

- Processor running POSIX compliant software or Windows One CAN interface device, or EtherCAT port (Ethernet NIC) Copley Controls CANopen or EtherCAT servo or stepping motor drive:
- Xenus, Accelnet, Stepnet

SOFTWARE REQUIREMENTS

- Any C++ compiler for use with CML. Some examples are: Microsoft Visual C++, C++ .NET, gcc CME 2 Version 3.2 or higher ; Copley Controls' application for
- amplifier setup, tuning, and configuration

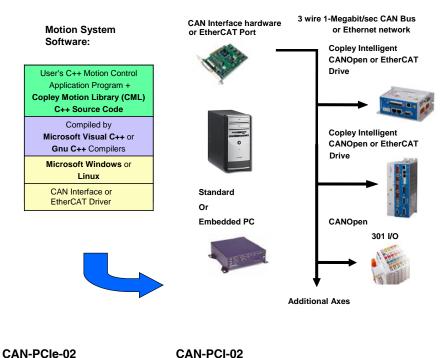

CANopen HARDWARE SUPPORTED

CAN bus interface products:

Copley Controls, Kvaser, Ixxat

I/O products: Wago

CML SYSTEM CONFIGURATION

Copley Controls CAN Interfaces

CAN-USB

CML Copley Motion Libraries

Commonly Used Classes and their Member Functions and Variables

Amplifier Object (nandles all control and	monitoring communications with an amplifier	r using CANopen Motion DSP-402 compatible objects)
Amplifier Initialization	Initialize	Initialize the amplifier on the CANopen network with the appropriate CAN address and start communications
Amplifier Modes and Status Information	Disable	Disable the amplifier
	Enable	Enable the amplifier
	ClearFaults	Clear any latching faults on the amplifier
	ReadEventSticky	Read events with automatic clear
Position and Velocity	PositionActual	Read the actual encoder position
	PositionError	Read the position error (difference between position command and actual position)
Homing	GoHome	Go home executes the homing routine as specified in the home settings object
Quick Stop Support	HaltMove	Halts current move using pre-programmed halt mode
Point-to-Point Move Support	MoveAbs	Perform an absolute point-to-point move using the pre-configured profile settings
	MoveRel	Perform a relative point-to-point move using the pre-configured profile settings
Amplifier Event Processing	WaitMoveDone	Waits for the currently running move to finish, or for an error to occur
	CreateEvent	Create an event that monitors amplifier events for specific conditions
Unit Conversion Functions	CountsPerUnit	Stores a scaling factor for converting between an amplifier's default units (encoder counts) and user-defined units
Profile Settings Object (for setting up mo	tion profile)	
Profile Settings	ProfileType	Gets/sets the profile type (SCurve, Trap, Velocity)
	ProfileVel	Gets/sets profile velocity value (velocity that the motor attempts to reach during the move)
	ProfileAcc	Gets/sets the profile acceleration value (acceleration that the motor uses whe starting the move)
Linkage Object (for performing coordinat	ed multi-axis motion)	
Linkage Object Methods	Initialize	Initializes a linkage object by assigning Amplifiers to it
	МоvеТо	Multi-axis move. Target positions are passed as an array.
	WaitMoveDone	Wait until the multi axis move is complete. If the move does not complete by the time specified, the function will return
Event Object (for monitoring events from	a given amplifier)	
Event Object	Start	Begins monitoring for an event to occur. Generates a single callback to a use subroutine when the chosen event occurs, or timeout has expired
	Stop	Stop monitoring
CopleyMotionLibrary Object (high level o	bject that enables sophisticated debugging)	
Debug logging	DebugLevel	Gets/sets the debug message level. When enabled will record CAN message from and to all the amplifiers along with actions and faults that are useful in debugging motion programs
O Object (controls communications with	a CANopen DS-401 compatible I/O module)	
Digital I/O	Din8Read, Dout8Write	Read a group of 8 digital inputs or write a group of 8 digital outputs
Analog I/O	Ain16Read, Ain16Write	Read a 16-bit analog input or write a 16-bit analog output
